

How to Use the Twiddler

Striking a Chord

The Twiddler's one-handed keyboard offers rapid mobile text entry on any device with Bluetooth. Using chords of keystrokes, it does all the work of a standard computer keyboard with only 16 keys.

On a piano you can play a single note by striking one key or you can play a chord by striking a number of keys at once. The Twiddler works in a similar way.

Using a combination of single keystrokes and chords, you can type all the letters, characters, symbols and commands found on a standard keyboard. The Twiddler offers you more than 1,000 programmable chords in multiple languages. You can even customize your Twiddler by creating your own chords.

The Twiddler Typing Tutor

As fast as a quick brown fox...

The Typing Tutor allows the user to learn the 16 key system of the Twiddler incredibly quickly, making dreaded data entry easy to accomplish. You can change the keys to suit your needs and store blocks of text that can be typed with a single chord. With basic chording codes the average person can type between 30 and 60 wpm, however the fully customizable keyboard can allow the user to key in anything up to 260 wpm.

There are twelve keys on the front of the Twiddler arranged in three columns and four rows. Each of your fingers is assigned to a specific row of three keys across. The Twiddler generates characters by the release rather than the initial press of a key so you do not have to worry about whether you have pressed all the keys in a chord at exactly the same instant.
