

# The Twiddler3

## A Wearable's Wingman

When Google released the Glass last year, it had one eye on the Twiddler and asked us to refine and redesign it as a wireless device. They came with a list of specs that needed to be introduced to the Twiddler's UI and the Twiddler 3 was born.

The Twiddler lets you type and navigate faster on your mobile phone, tablet, or wearable without the hindrance of a bulky traditional keyboard. Perfect when you're away from the office or on your morning commute, the Twiddler can increase your productivity like never before.

*“We're at the start of a wearable revolution. As smartwatches, glasses and bracelets become more popular, how we interact with those devices becomes increasingly important.”*

### Google Glass

We have been working with Google Glass for several months on the redesign of the Twiddler. It's easy to see why. The Twiddler will make it easy to enter data wirelessly without having to tap the temple of your Glass or use awkward voice commands in public. We expect Google to issue an update soon that will allow Glass to be paired with the Twiddler.

### Smartphones and Tablets

The Internet is full of “autocorrect” memes for a reason. The Twiddler gives you a lightweight portable keyboard wherever you need it.

### Watches

Samsung Gear and the Apple Watch are expected to lead a wave of new smartwatches. Bring them to life with the Twiddler.

### ... and everything else

Are we forgetting anything? The Twiddler was made with the Internet of Everything in mind.
